

Individual Project Requirements

- ◆ First time users will be required to create an account, by inputting some personal information and making a username and password for their business before getting started with anything for the process.
- ◆ Personal Information includes date of birth and email.
- ◆ When a user has an account, they must login every time they access the site for increased security.
- ◆ Users will first answer various questions about their business structure, like what type of store it is, and what is being used to keep track of inventory inside the store.
- ◆ Users will fill out a mini business questionnaire immediately after creating their account. They will answer three questions, which will give you the option to select multiple answers, about their products being sold, their cash register, and product scanner.
- ◆ After filling out the questionnaire, users will fill information about their business so it can be used to create their business page.
- ◆ Information they will fill include their business name, address, type of business, the owner or manager, and a mission statement. If a user does not want to share that information, they will have the option not to.
- ◆ The site will be available for use and will have their information displayed on a welcome screen.
- ◆ There will be two sections in the site, a product and storage section.
- ◆ Product section will allow users to add products they have to their site. For each product, they will be able to add its name, quantity, description, and type of product.

- ◆ If a product is selling at a high rate, there will be a hot product sign next to it, and the rate to see it if it is selling high is dependent on the type of product it is.
- ◆ When a product is at 20% or less of its original stock amount, it will be considered as low stock and will say that on that products information.
- ◆ When a product goes out of stock, it will immediately update as out of stock on the products information.
- ◆ There will be a section for storage that will allow users to customize the amount of space available by inputting the dimensions of the room by length x width x height in inches.
- ◆ Users may add how much space they want to be used in that room for storage and see if any incoming products will be able to fit in that space. They may also add what space is already being used.
- ◆ They will be able to edit the space, add and remove items at any time.
- ◆ If a user needs help with any functions or has any questions, there will be a mini section on the site where they can send a question and a site admin will answer.
