Tool Selection Review

Host:

I will be using HostGator because it is simple and secure for a very cheap price.

Website:

I will be using WordPress for my site because it uses various scripting and programming languages needed like html, CSS, php, and some JavaScript. The sites platform already has a skeleton for the code so I believe it will not be as challenging. For my group project, we are using this site so I will already gain a bit of experience too.

Languages:

PHP:

PHP is WordPress's primary language, and I will use it to implement the business products, storage capacities, and other functions the site will provide.

CSS:

I will use CSS to make the menu and other sections of the site look as clean and neat as it should. CSS is great for styling a site and is needed or else it will look dull.

HTML:

HTML is needed for creating paragraphs, headings, and other basic parts in a webpage. Without HTML, a language like CSS would not be able to function. I will be using HTML to create and structure my site, especially since many business pages include a lot of sections. It will be most effective for sectioning the main menu and the products descriptions.

JAVASCRIPT:

JavaScript is a more advanced programming language and is used for more in-depth detail. I may use JavaScript for setting up the specs and details of the storage room for the businesses.
